

NG Bootstrap - Angular powered Bootstrap widgets

Angular widgets built from the ground up using only **Bootstrap 4** CSS with APIs designed for the Angular ecosystem. No dependencies on 3rd party JavaScript.

Dependencies

The only two dependencies are **Angular** and **Bootstrap 4** CSS. Here is the list of minimal required versions:

ng-bootstrap	Angular	Bootstrap CSS
1.x.x	5.0.2	4.0.0
2.x.x	6.0.0	4.0.0
3.x.x	6.1.0	4.0.0
4.x.x	7.0.0	4.0.0
5.x.x	8.0.0	4.3.1

Installation

You also need to add Bootstrap 4 CSS to your application by using your preferred way (it really depends on the setup you're using). And update your `angular.json` with something like:

```
"styles": [  
  "node_modules/bootstrap/dist/css/bootstrap.min.css"  
]
```

Please note that you need only CSS and **should not** add other JavaScript dependencies like `bootstrap.js`, `jquery` or `popper.js` as ng-bootstrap's goal is to completely replace them.

After installing the above dependencies, install `ng-bootstrap` via:

```
npm install --save @ng-bootstrap/ng-bootstrap
```

Once installed you need to import our main module:

```
import {NgbModule} from '@ng-bootstrap/ng-bootstrap';

@NgModule({
  ...
  imports: [NgbModule, ...],
  ...
})

export class YourAppModule {
}
```
